

Thank you again for taking a look at this. I really appreciate your help.

Genex is an early system we are building to take a parent's concerns, ask focused developmental questions, estimate where the biggest gaps may be, and turn that into short, practical home activities based on the family's available time.

This packet includes:

- a simple visual of the Genex logic flow,
- a case review packet with sample child profiles, questions, outputs, and activity plans,
- a milestone spreadsheet for review.

At a high level, the current system:

- starts with the child's age, diagnosis/condition, and parent concerns,
- routes those concerns into developmental categories,
- asks milestone questions,
- estimates developmental age by category,
- assigns a support tier,
- recommends short home activities for the highest-priority areas.

The main categories right now are:

- Movement / Physical
- Social / Emotional
- Language / Communication
- Cognitive / Adaptive

The biggest questions I would love your feedback on are:

- Do the developmental estimates and support levels feel reasonable?
- Do the suggested activities feel practical, safe, and aligned with the main need?
- What feels missing, overcalled, undercalled, or just not quite right?

Even quick reactions are extremely helpful. High-level comments like "this overcalls language," "motor looks right," or "activities need to be more specific" are very valuable.

This is still an early prototype, and the goal here is to improve the logic before moving further into real parent-facing use.

Thank you again — your feedback will directly shape the next version of Genex.
