

Genex CDC Milestone Review Guide - v2

CDC backbone + advisor supplemental follow-up review

Why we are asking for this review

We want to keep the CDC milestone table as the structured backbone of the Genex interview. However, in a few clinically important areas, the CDC milestones alone may be too broad to fully distinguish certain case types. Examples include speech intelligibility / motor-speech concerns, mild expressive-language boundary cases, transitions / regulation, and feeding or oral-motor follow-up. The goal is **not** to replace CDC. The goal is to identify only a small number of reviewed supplemental follow-up items where the backbone feels too thin.

How to use the new spreadsheet tab

- Open the new sheet named **advisor_supplemental_review**.
- For each starter row, either confirm that no supplement is needed, or propose 1-3 short supplemental milestone follow-up items.
- Fill the **months** column with the approximate age band where the new follow-up item should be asked.
- Use **proposed_supplemental_milestone_or_followup** for the exact short item you would want the system to ask.
- Use **why_this_would_help** to briefly explain what blind spot the new item would fix.
- Only mark **include_in_model_after_review** when you would support adding that item into the working supplemental bank.

What is already prefilled

The new tab includes starter rows for the main issues we observed in testing so far:

- **speech_intelligibility** - Emma-like cases where language is recognized, but speech-motor specificity is still too broad
- **expressive_language** - Aria-like cases where mild expressive-language delay may be undercalled
- **emotional_regulation_transitions** - Ryan-like cases where transitions / tantrums / rigidity need more specific follow-up
- **feeding_oral_motor** - cases where feeding or oral-motor concerns may need clearer separation from general movement or language
- **gross_motor_mobility_and_coordination** - motor-disability cases where condition-sensitive follow-up items may be needed

What kind of comments are most helpful

- “No supplement needed here; CDC is enough.”
- “Add 2 follow-up items for speech clarity / consistency.”
- “This should be a regulation follow-up, not a broad social item.”
- “This needs a safer, mobility-adapted follow-up item.”

Thank you again. This review will help us preserve CDC as the main developmental backbone while adding only a very small, expert-reviewed supplemental bank where it is truly needed.
