

Short Review Guide for the CDC Milestone Subdomain Sheet

Thank you for reviewing this updated milestone table. We added a new **subdomain** column to make the milestone framework more specific and more useful for routing parent concerns and selecting better questions in the Genex prototype.

What feedback is most helpful

- Whether the **subdomain** label looks correct.
- Whether a milestone seems misclassified.
- Whether a milestone could reasonably belong to more than one subdomain.
- Whether an important subdomain is missing.
- Whether any labels feel too broad, too narrow, or unclear.

Main question

Does this subdomain structure feel clinically reasonable and useful for distinguishing different kinds of concerns within the broader developmental domains?

Current subdomains by main category

1. Movement / Physical

Subdomains: gross_motor, fine_motor, balance_coordination, feeding_oral_motor

Used for: sitting, crawling, standing, walking, jumping; grasping and hand use; balance, stairs, coordination; feeding and oral-motor function.

2. Social / Emotional

Subdomains: social_reciprocity, joint_attention_social_engagement, play_interaction, emotional_regulation_transitions

Used for: smiling, eye contact, shared engagement, play with others, imitation, separation, calming, transitions, and flexibility.

3. Language / Communication

Subdomains: receptive_language, expressive_language, speech_production_motor_speech, gestures_communication_intent

Used for: understanding directions, word use and phrases, speech clarity and sound production, and gesturing or communication attempts.

4. Cognitive / Adaptive

Subdomains: attention_problem_solving, cause_effect_functional_play, adaptive_self_care, routines_following_directions

Used for: attention and problem-solving, functional or pretend play, dressing and feeding skills, and following directions or routines.

Examples of useful comments

- “Should be expressive language, not receptive.”
- “Could fit both fine motor and adaptive.”
- “Missing oral-motor / feeding category.”
- “This subdomain is too broad.”

These subdomains are intended as a first-pass internal structure to help us better route parent concerns, select more relevant milestone questions, and distinguish different patterns within the broader developmental domains. Thank you again - this feedback will directly help improve how the system selects questions and interprets parent concerns.
